

CARVANA

Parts Request Workflow

v2.0 • Onboarding Guide

Everything you need to request parts, work the queue, and find the tools — the form, the tracking spreadsheet, and quick-scan QR codes.

WHAT'S INSIDE

- 1 How the pipeline works
- 2 Submitting a request (the Form)
- 3 Using the spreadsheet
- 4 Behind the scenes: automation
- 5 Quick links & QR codes

1 • How the pipeline works

The Parts V2 pipeline moves a vehicle's parts request from the shop floor to a picked bin with a full audit trail. Every request follows the same path:

1. SUBMIT	A teammate scans the QR code (or opens the link) and submits the Google Form with the stock number, build load level, and lot status.
2. INTAKE	The submission lands on the Form Responses 1 tab. Automation validates it, stamps it PROCESSED , assigns a Request ID, and logs a REQUESTED event.
3. QUEUE	The request appears on the Processing tab — the live work queue the parts team monitors.
4. PICK	A parts picker pulls the part, and the bin location (e.g., URGB4A) is recorded. A PICKED event is logged with the picker's name and timestamp.
5. COMPLETE	When the request is fulfilled it's closed out with a COMPLETED event and drops off the live queue. The full history stays in the event log.

Where things live

Everything for this pipeline sits in one Drive folder: **Carvana Parts Workspace > Parts V2**. It holds the tracking spreadsheet, the request form, the **Parts Request Backups** folder, and the automation source (parts-picker.zip). Links and QR codes for all of it are in Section 5.

2 • Submitting a request (the Form)

Use the **Parts Request Workflow (v2.0)** Google Form for every parts request. You must be signed in to your **@carvana.com** account — your email is captured automatically, so there's nothing to type for identification.

Step by step

1. Scan the **Form QR code** (Section 5) or open the form link.
2. Sign in with your Carvana Google account if prompted.
3. Enter the **Stock Number** of the vehicle (the full 10-digit number, e.g., 2005037959). Double-check it — this is how the request is matched to the vehicle.
4. Select the **Build Load Level**.
5. Select the **Lot Status**.
6. Hit **Submit**. That's it — no follow-up needed. Your request is queued automatically and shows up on the Processing tab within moments.

Field reference

Field	What to enter
Stock Number	The vehicle's stock number, digits only. One vehicle per submission — submit the form again for each additional vehicle.
Build Load Level	L1, L2, H1, H2, H3 , or Rework — the vehicle's current build load level.
Lot Status	Parts Hold, Sublet Complete, Paint Parts , or Rework — where the vehicle stands on the lot.
Email	Captured automatically from your Carvana sign-in. Used for the Requester column and the audit log.

Made a mistake? Don't edit the response sheet. Submit a corrected form entry and add a note for the parts team, or flag it in the parts-requests Slack channel so the queue can be updated on the Processing tab.

3 • Using the spreadsheet

The **Parts Request Workflow (v2.0)** spreadsheet is the single source of truth for the pipeline. Most teammates only ever need to *read* it — the automation keeps it in sync. Here's what each tab is for:

Tab	Purpose	Who edits it
Form Responses 1	Raw intake from the Google Form. Each row gains a Sync Status of PROCESSED once automation has ingested it.	Nobody — hands off. It's written by the form and the automation.
Processing	The live work queue : Requested time, Requester, Stock Number, Build Load Level, Lot Status, Bin Location, Request ID, and Notes. This is the tab the parts team works from day to day.	Parts team — bin locations and notes as requests are worked.
_EventLog	Append-only audit trail. Every REQUESTED → PICKED → COMPLETED event with request ID, actor, source, bin code, and timestamp. Use it to answer “what happened to this request?”	Nobody — automation only. Never edit or sort this tab.

Reading the queue

- **Request ID** is the key that ties a Processing row to its _EventLog history — copy it into a find (Ctrl+F) on _EventLog to trace a request end to end.
- **Bin Location** (e.g., URGB4A) is filled in at pick time and tells you exactly where the part is staged.
- A row disappearing from **Processing** is normal — it means the request was completed. Its history lives on in **_EventLog**.

Ground rules

DO	Filter and search freely; use filter views instead of sorting shared ranges.
DO	Add context in the Notes column on the Processing tab.
DON'T	Insert, delete, or reorder rows on Form Responses 1 or _EventLog — it breaks the sync and the audit trail.
DON'T	Clear the Sync Status or Request ID columns.

4 • Behind the scenes: automation

A Google Apps Script system (the **parts-picker** project, archived in the Parts V2 folder as `parts-picker.zip`) runs the pipeline so nobody has to shuffle rows by hand. You don't need to touch it to use the workflow, but it helps to know what it does:

Intake & validation

Watches for new form submissions, validates them, assigns Request IDs, marks rows PROCESSED, and places them on the Processing queue.

Event ledger

Writes every REQUESTED, PICKED, and COMPLETED event to `_EventLog` with actor and timestamp — the pipeline's audit trail.

Pick handling

Records bin locations and pick events as the parts team works the queue.

Shift & end-of-day reporting

Summarizes activity per shift and at end of day.

Backups & health

Saves backups to the **Parts Request Backups** folder and runs health checks; a rebuild routine can reconstruct the queue from the event log if the Processing tab is ever damaged.

If something looks stuck (a submission not appearing on Processing after a few minutes, or Sync Status not flipping to PROCESSED), don't repair the sheet manually — contact the workflow owner so the automation can be checked and, if needed, the queue rebuilt safely.

5 • Quick links & QR codes

Scan with your phone camera, or click the links in the digital copy of this guide. Print this page and post it at parts stations. Carvana sign-in required for all three.

Request Form

Submit a new parts request
